The N- and O-linked carbohydrate chains of human, bovine and porcine

AT plasminogen. Specificity in relation to sialylation and

AT fucosylation patterns.", 173:57-63 (1988).

Eur. J. Biochem. 173:57-63 (1988).

-! FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS

A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING

EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION,

CRAPARIAN FOLLICLE. IT ACTIVATES THE UROKINASION,

ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH

ACTIVATOR, COLLAGENASE SIBRIN, FIBRONECTIN, THROMBOSPONDIN,

LAMININ AND VOW WILLEBRAND FACTOR.

CC -!- CATALYTIC ACTIVITY: PREferential cleavage: Lys-|-xaa > Arg-|-xaa,

CC -|- higher selectivity than trypsin. Converts fibrin into soluble

MISCELLANGOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
MISCELLANGOUS: IN THE PRESENCE OF THE INHIBITOR, THE ACTIVATION
INVOLVES ONLY CLEAVAGE AFTER ARG-580, RESULTING IN 2 CHAINS HELD
ACTIVATION INVOLVES ALSO REMOVAL OF THE INHIBITOR, THE
ACTIVATION STRUCKS ALSO REMOVAL OF THE ACTIVATION PEPTIDE.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   synthesis...;

J. Biol. Chem. 264:5957-5965(1989).

J. FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS PROTECOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION, AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAAFIAN FOLLICLE. IT ACTIVATES THE WOKINASE TYPE PLASMINGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS CI AND CS. IT CLEAVES FIBRIN, FIBRONECTIN, THROMEOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.

Schaller J., Straub C., Kaempier, V. Rickli E.E.;
"Complete amino acid sequence of canine miniplasminogen.";
Protein Seq. Data Anal. 2:445-450(1989).
-!- FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS
A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOMENT, TISSUE REMOBELING, TUMOR INVASION,
AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE
GRAAFIAN FOLLICLE. IT ACTIVATES THE UROKINASE-TYPE PLASMINOGEN
ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH
AS CI AND CS. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN,
I-AMININ AND VON WILLEBRAND FACTOR.
-!- CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa, higher selectivity than trypsin. Converts fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       STREPTOKINASE.

MISCELLANEOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN MISCELLANEOUS: PTASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.
SIMILARITY: Contains at least 1 kringle domain.

"Complete amino acid sequence of ovine miniplasminogen.";

Protein Seq. Data Anal. 5:21-25(1992).

-!- FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLCOD CLOTS AND ACTS AS A PROTECLYIC PACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMOBELING, TUMOR INVASION.

C BAND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAAFIAN FOLLICLE. IT ACTIVATES THE URCKINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS CI AND CS. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND VON WILLEBBRAND FACTOR.

C -!- CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-xaa > Arg-|-xaa; higher selectivity than trypsin. Converts fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -:- ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN
ACTIVATORS. BOTH PLASMINOCEN AND ITS ACTIVATORS BEING BOUND TO
FIBERIN. CANNOT BE ACTIVATED WITH STREEPTOKINASE.
-!- MISCELLANEOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
INMEDIATELY AFTER DISSOCIATION FROM THE CLOT.
-!- SIMILARITY: Contains at least 2 kringle domains.
                                                                                                                                                                                    Ovis aries (Sheep).

CANNOT BE ACTIVATED WITH STREPTOKINASE. PEPRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE. PER N. H.LINKED GLYCAN CONTAIN N. ACETYLLACTOSAMINE AND SIALIC ACID. O-LINKED GLYCANS CONSIST OF GAL-GALNAC DISACCHRIDE WITH IS MODIFIED WITH UP TO 2 STALIC ACID RESIDUES (MICROHETEROGENEITY). MISCELLANEOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT. SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY. SIMILARITY: CONTAINS 5 Kringle domains.
              CARBUTDRAIDE LINAMOGE 311ES.

Jenstinogen. Specificity in relation to sialylation and fucosylation patterns.";

Eur. J. Biochem. 173:57-63 (1988).

I. FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS A PROTECUTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION,

AND INFLAMMATION; IN OUTLATION IT WEARENS THE WALLS OF THE GRAAFIAN FOLLICLE. IT ACTIVATES THE URCKIMSE-TYPE PLASMINGEN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS C1 AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, ILAMININ AND VON WILLEBRAND FACTOR.
CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-Xaa; higher selectivity than trypsin. Converts fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            R PRINTS; PRO0725; CIYANDTREEIN.

Biol. Chem. 264:5957-5965(1989).
-!- FUNCTION: Apo(a) is the main constituent of lipoprotein(a)
(Lp(a)). It has serine proteinase activity and is able of autoproteolysis. Inhibits tissue-type plasminogen activator 1.
Lp(a) may be a ligand for megalin/Gp 330.
-!- SUBUNIT: Disulfide-linked to apo-B100. Binds to fibronectin and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tomlinson J.E., McLean J.W., Lawn R.M.; "Rhesus monkey apolipoprotein(a). decorin (By similarity).

-!- PTM: N- and O-glycosylated (By similarity).

-!- DISEASE: Elevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with naturally occurring proteolytic fragments are correlated with plasminogen kringles IV and V is thought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin(gen) binding.

-!- MISCELLANEOUS: Apo(a) is known to be proteolytically cleaved, leading to the formation of the so called mini-Lp(a). Apo(a) fragments accumulate in arherosclerotic lesions, where they may promote thrombogenesis. O-glycosylation may limit the extent of proteolytic fragmentation (By similarity).

-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.

-!- SIMILARITY: Contains at least 10 kringle domains.

                                                                                                                                                                                                                    -I-BISEASE: Blevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with therosclerosis. Homology with plasminogen kringles IV and V is thought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin(ogen) binding.
-I-MISCELLAMBROUS: Apo(a) is known to be proteolytically cleaved, leading to the formation of the so called mini-lp(a). Apo(a) fragments accumulate in atherosclerotic lesions, where they may promote thrombogenesis. O-glycosylation may limit the extent of proteolytic fragmentation.
-I-SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.
                                                                                                                pTW: N- and O-glycosylated. The N-glycans are complex biantennary structures present in either a mono- or disalylated state. The O-glycans are mostly (80%) represented by the monosialylated core type I structure, NeuNAcalpha2-3Galbeta1-3GalNAc, with smaller amounts of disialylated and non-sialylated O-glycans also
associated with a lysine binding defect in Lp(a).";
Biochim. Biochim. 45.04 1227.44-45(1994).
-!- FUNCTION: Apo(a) is the main constituent of lipoprotein(a)
(Lp(a)). It has serine proteinase activity and is able of
autoproteolysis. Inhibite tissue-type plasminogen activator 1.
Lp(a) may be a ligand for megalin/Gp 330.
-!- SUBUNIT: Disulfide-linked to apo-B100. Binds to fibronectin and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  APOLIPOPROTEIN(A).

"Cloning and structural analysis of leydin, a novel human serine
protease expressed by the Leydin, ells of the testis.";

Eur. J. Biochem. 261:244-250(1999).

-!- FUNCTION: PLAYS A ROLE IN NEURONAL PLASTICITY AND THE PROTEOLYTIC
ACTION MAY SUBSERVE STRUCTURAL REORGANIZATIONS ASSOCIATED WITH
LEARNING AND MEMORY OPERATIONS (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Brian and Leydig cells of the testis.

-!- SIMILARITY: Centains 1 kringle domain.

-!- SIMILARITY: Contains 4 SRCR domains.
                                                                                                                                                                                                                                                          Proba K., Gschwend T.P., Sonderegger P.; "Cloning and sequencing of the cDNA encoding human neurotrypsin."; Biochim.
